

The Ashtead Technology stand at AQE 2013, the Air Quality and Emissions Show, will feature a comprehensive range of the latest air monitoring instruments, providing visitors with an opportunity to learn about new technologies and to try out some of the latest equipment. In addition, Ashtead's staff will be available to provide help and advice on the choice of instrumentation and to discuss the advantages of renting.

Ashtead Technology will be on stand 8, and the latest gas and particulate monitoring instruments will be on show for applications including occupational safety, leak detection, emissions monitoring, landfill gas and ambient monitoring.

Only a select group of manufacturers' products make it into the Ashtead Technology hire fleet. For example, the stand will feature intrinsically safe personal multigas monitors from Crowcon and the latest particulate and gas detectors from TSI Instruments and RAE Systems. Visitors will also be able to try the TDL-500 portable laser diode from Geotech and the new GA5000 landfill gas analyser which is EX approved, smaller, lighter and faster than its predecessors with a new colour screen. The stand will also feature a comprehensive suite of instruments for flue and stack gas monitoring including the Horiba PG250, the SICK Bernath and the Testo 350 XL.
