

The 6th annual WWT Water Industry Technology Innovation Conference is being held in Birmingham on the 30th November and ALS Environmental are proud to be exhibiting.

As the water industry prepares for the next Asset Management Period (AMP) cycle and Price Review 2019 (PR19), water companies must find more innovative ways to enhance their business plans and prepare for long term challenges. Increased regulatory pressures and customer expectations, along with competition, has essentially led to a need for new solutions to keep costs low and keep efficiency high.

Building on the success of the previous five years, the 2017 conference will provide attendees with the opportunity to discover how their peers are utilising technologies such as desalination, gasification, drones and other advancements. It will also address how to provide the delegates with the tools to facilitate innovation within their own organisations.

The conference will offer a wealth of knowledge from a selection of guest speakers. Some of the innovation goals and long term planning subjects being discussed are 'Encouraging innovation in the water sector - Ofwats expectations for PR19', 'How are we planning for long term innovation' and 'Cross-sector innovation: how could the gas sector creates an innovative culture'. There are also 'breakout' sessions in the afternoon designed for discussions and questions regarding additional technological advancements.
